SUPERIOR FEATURES OF POWER TEAM HYDRAULIC CYLINDERS:

We build our own cylinders in our ISO 9001 registered manufacturing facilities. All Power Team cylinders are date coded and stamped with a maximum pressure rating and capacity. Each cylinder we make complies with the demanding ASME B30.1 standard and are assembled/tested by certified assemblers and pressure tested to 125% of capacity before leaving our factories. Some other key features included:

- Cylinder bores are roller burnished to harden and smooth the surface, improving seal life by 30%.
- Base mounting holes withstand full cylinder capacity.
- Typical cylinder burst pressure range is from 25,000 to 35,000 psi, well-beyond extreme usage.
- Cylinders with gland nuts may be “dead-ended” at 10,000 psi.
- Eddy current and mag-particle inspections detect flaws in the steel.
- Material is removed from surface to ensure that any flaws are eliminated.

SELECTING THE RIGHT CYLINDER:

Step 1: Select the hydraulic cylinder that best suits the application.

Step 2: Select a hydraulic pump with adequate oil output and reservoir capacity to power cylinder.

Step 3: Select pump and valve option that is best suited to the cylinder and application.

CYLINDER SIZING CONSIDERATIONS:

1. What push or pull tonnage is required per cylinder in your application? Power Team recommends using 80% of the rated capacity and stroke to maximize product performance and safety.
2. What is the push or pull stroke length required?
3. Does the cylinder need to push, pull or both? (Single-acting cylinders extend the piston under hydraulic pressure. Double-acting cylinders extend and retract the piston under pressure.)
4. Does the application require multiple cylinders?
5. Is the application stationary, or must the components be light in weight for easy portability?
6. Do you need to extend a rod or cable through the center of the cylinder for the application, as in a tensioning operation?
7. Does the application require that the cylinder fit within limited-clearance work areas?
8. Does the application require that the cylinder be "dead-ended" at the end of its work stroke?
9. Will the cylinder need to withstand off-center loads? If yes, consider using swivel load caps.
10. Does the application require that the lifted load be supported for extended periods of time? Locking collars are ideal for such jobs, as are cribbing blocks.
11. Is corrosion resistance required? Our unique "Power-Tech" surface treatment is standard on many Power Team cylinders, and optional on many of our cylinders which feature steel construction.
12. Will the application involve high cycles (over 2,500 in the cylinder's lifetime)? Our "RD," "RH," "RP" and "C" series cylinders are ideal choices. Please refer to pages 12-13 for the capabilities of each cylinder.

WHAT TYPE OF CYLINDER DO YOU NEED?

1. To determine a cylinder's force capacity:

Force pounds

Cylinder Effective Area (sq. in.)

X

PSI from Pump

2. To determine oil capacity of a cylinder:

Oil Capacity (cu. in.)

Cylinder Effective Area (sq. in.)

X

Cylinder Stroke (in.)

3. To determine reservoir capacity needed for a multiple cylinder system:

Usable Oil

Oil Cap. of Cyl. (cu. in.)

X

Number of Cyl. in System

The following guidelines are for general lifting and construction applications. Hydraulic tools, pullers and presses may fall outside these recommendations. Always check to see that the pump's "usable reservoir capacity" exceeds the cylinder(s) oil capacity.

Cribbing Block Operation

Convert Power Team "Shorty" cylinders to mechanical cribbing devices. They are more stable and safe than timber or other awkward, makeshift methods. Ideal for lifting applications such as structure moving. Reduces cribbing time dramatically. In effect, increases the stroke of the cylinder as stacking pads act as cylinder extensions:

RGP5652, RGP2202

Features

- The Mechanical locking collar safely supports loads for an extended period of time removing the chance of a hydraulic leak down causing a load shift.
- The Patented 5 degree deep swivel cap concentrates loads to minimize offset conditions.
- Compact design is ideal for confined areas
- Buttress thread design supports locking collar strength and security along with time saving quick run-down
- *Power-Tech* nitro-carburization surface treatment inhibits corrosion and provides exceptional durability
- Weep hole provides visual indication of piston over travel
- One high flow 3/8" NPTF female half coupler and carry eyelets are included

Technical Dimensions

Pancake locking cylinders are ideal for tight quartered locations.

SELECTING THE RIGHT PUMP:

Step 1 Select the hydraulic pump that best suits the application.

Step 2 Select the series of pump with adequate oil output and reservoir capacity to power tool.

Step 3 Select pump within series with the valve option that is best suited to the tool and application.

PUMP SIZING CONSIDERATIONS:

1. What maximum system operating pressure (psi) is required?
2. What volume of oil delivery is required? (For manual pumps, cu. in. of oil per handle stroke. For powered pumps, cu. in./min. of oil).
3. Is a single or two-speed pump required? (Two-speed pumps deliver high oil volume at low pressure for rapid cylinder piston advance, then shift to high pressure, low volume stage under load).
4. What is the preferred source of power?
 - a. Manual (hand or foot operated): Provides portability, can be used where electricity or shop air are not available.
 - b. Air/Hydraulic: Uses shop air or a portable air compressor.
 - c. Electric/Hydraulic: What voltage is available? Is a battery operated pump preferred?
 - d. Gasoline Engine/Hydraulic: Powers high-output pumps at remote job sites where air or electricity are unavailable.
5. Is portability of the pump a factor to consider?
6. Will the pump be used intermittently, or will it need to provide high-cycle operation? Does the application require that the pump be capable of starting under load?
7. Is fluid heat build-up a factor in your application? High-cycle applications may require a larger capacity oil reservoir for cooling.
8. Will the application require large displacement or multiple cylinders? Reservoir size and pump output levels will be factors to consider.
9. Does the working environment require a pump having a low operating noise (dBA) level?
10. Must the pump operate in a spark-free environment?

▶ **MANUALLY-OPERATED HYDRAULIC PUMPS:**

- **P12, P23, P55** – These single-speed pumps are for use with single-acting cylinders.
- **P19/P19L, P59/P59L, P59F, P157, P159, P300, P460** – These two-speed pumps are used with single-acting cylinders. The two-speed feature provides high oil volume for fast cylinder piston approach to the work, then the pump automatically shifts to the high pressure stage. This reduces the number of pump handle strokes required.
- **P157D, P159D, P300D, P460D** – These two-speed pumps are used with double-acting cylinders.

▶ **AIR / HYDRAULIC PUMPS:**

Used where air is the preferred energy source or where electricity is not available. Ideal for use in petrochemical, mining or other flammable or explosive environments.

- **PA6 Series** – These single-speed pumps drive single or double-acting cylinders.
- **PA9 Series** – These new single-speed pumps drive single-acting cylinders and are ideal for powering portable hydraulic tools.
- **PA50 Series** – These single-speed pumps drive single or double-acting low pressure (3,200 psi) cylinders.
- **PA60** – This two-speed pump is equipped with a manifold to operate multiple cylinders, and provides a 2-gallon reservoir.
- **PA64** – Similar to PA60, this two-speed pump drives single or double-acting cylinders.
- **PA172 and PA174** – These “economy” two-speed pumps drive single or double-acting cylinders, depending on the model chosen. Provide a low weight-to-output ratio.

All of the following pumps are two-speed models, and can be used to drive single or double-acting cylinders.

- **PE/PB10 Series “Quarter Horse” Series** – These pumps feature a 1/4 hp electric motor. A battery-powered version is available. Having a low noise level and weighing just 20 lbs. They are ideal for powering portable hydraulic spreaders, nut splitters, pipe flange spreaders and other tools.
- **PE17 Series** – CSA rated for intermittent duty, these feature a 1/2 hp, single-phase induction motor with a low noise level (67-81 dBA). Smaller generators and low amperage circuits can be used as a power source.
- **PE46 Series** – Powered by a 1-1/2 hp, single-phase induction motor, operates at a moderate noise level of 77-81 dBA. CSA rated for intermittent duty.
- **PE18 Series** – CSA rated for intermittent duty, these feature a 1/2 hp, single-phase universal motor with a noise level of 85-90 dBA. Provide high-performance at a low price. Has low amperage draw.
- **PE30 Series** – Equipped with a 1 hp, single-phase permanent magnet motor, have a noise level of only 82-87 dBA. CSA rated for intermittent duty, and requires a relatively low voltage. Ideal for use in general construction applications. Roll cage/handle protects the motor and controls.
- **PE55 and PED25 Series** – Equipped with a 1-1/8 hp, single-phase universal motor, have a 90-95 dBA noise level. Offer the best weight to performance ratio of any Power Team electric/hydraulic pump. CSA rated for intermittent duty. The PED25 versions are “dual flow” pumps which deliver the same low and high pressures to both valves, and have a noise level of 80-85 dBA. They have a 1-1/2 hp induction motor.

▶ **ELECTRIC / HYDRAULIC PUMPS: (CONT.)**

- **PE60 Series** – These Vanguard® Supreme® pumps provide trouble-free service in the most severe working environments. Powered by a 1-1/8 hp, single-phase motor, has a moderate noise level of 80-85 dBA. Starts under load even at the reduced voltages encountered on construction sites. High-output pumps, ideal for use with post-tensioning/pre-stressing jacks and other high-pressure hydraulic tools.
- **“Custom-Built” Pumps** – Power Team offers you “assemble to order” electric/hydraulic pumps to suit unique applications. You can choose from pre-engineered, off-the-shelf components to customize your pump.

Pumps

Features

STEEL HAND PUMPS BEST SUITED FOR MRO APPLICATIONS.

- All metal construction won't burn through in welding environments.
- Formed metal handle provides rigidity, and reduces operator fatigue with grip.
- Convenient fill port enables pumps to be filled in a horizontal or vertical position, excluding P12.
- Fill cap seal acts as safety valve preventing over-pressurizing of reservoir.
- Large valve knob gives added control for slowly metering loads down.

Pump Protection System

Power Team hand pumps, with the angled fill port, have a built in "relief valve" protection system. This system is designed to protect over-pressurization of the reservoir from sudden back pressure. This system also works as a seal to prevent oil leaks only fill to bottom of threads.

(1) 2-Way Auto Dump Function: Flapper handle in "hold" position will allow the tool to advance and maintain pressure when the motor is shut-off, flapper handle must be switched back to retract and dump pressure. Flapper handle is set to "return" position, power on will advance tool and power-off will retract tool and dump pressure.
 (2) Auto Dump Function: Power on - tool advances, and power-off - tool returns, releasing pressure to tank.

(3) Using the external knob, the pressure regulator valve allows the operator to externally adjust the pressure on demand, ranges from 500 - 10,000 psi.

(4) Four-way valve direction is controlled by the handle lever. Three position; Advance, hold, retract.

(5) For crimping applications only. Once full pressure is reached, RV provides audible noise.

† For maximum efficiency, recommended input flow is 5 gpm at a maximum pressure of 2,000 psi. Higher flows and/or pressures must be compensated for at the system pump (e.g., relief valve, variable flow devices, etc.)

* Posi-Check® valve design, Posi-Check® guards against pressure loss when valve is shifted from "advance" position to "hold" position.

CAUTION

This system should not be used for lifting applications.

Pumps

ORDER A “CUSTOM BUILT” HYDRAULIC PUMP

“Assemble to Order” means you can choose a basic pump with gas, air or electric motor. Then select the proper valve, gauge, pressure control, motor control and reservoir. You get a two-stage pump that gives high oil volume for fast cylinder approach (and return with double-acting cylinders) in the first stage and high pressure in the second stage.

1 1-1/8 HP UNIVERSAL MOTOR

These motors start under full load and are suitable for operation up to 5,000 or 10,000 psi. The motor is 1-1/8 hp, 12,000 rpm, 115 or 230VAC (specify), 50/60 cycle AC single-phase (25 amp draw at 115VAC). With proper valve they can be used with single or double-acting cylinders.

NOTE: Remote control available.

2 1-1/2 HP JET MOTOR, SINGLE & THREE-PHASE

Feature low noise level, moderate speed for long service and are ideal for fixed applications. Motor is 1-1/2 hp, 3,450 rpm, 115 or 230VAC, 50 or 60 cycle (specify), AC single-phase with thermal overload switch. Can be used with single or double-acting cylinders and equipped with remote control. Also available in 230/460VAC, three-phase (specify).

NOTE: These do not start under full load unless valve is in “neutral” (requires open or tandem center valve) and are not recommended for frequent starting and stopping.

3 3 HP JET MOTOR, THREE-PHASE

Gives low noise level and long life due to its moderate operating speed. Ideal for fixed installations. Consists of basic 10,000 psi pump, jet pump motor: 3 hp, 3,450 rpm, 230/460VAC, 60 or 50 cycle (specify). AC three-phase, with thermal overload switch. Equipped with internal and external relief valve. Will start under load.

4 3 HP AIR MOTOR

This pump is ideal for use where electricity is unavailable or cannot be used. The 5,000 or 10,000 psi pump has a 3 hp air-driven motor at 3,000 rpm (optimum performance based on 80 psi air pressure and 50 cfm at the pump). You can drive single or double-acting cylinders with the correct valve.

NOTE: 80 psi air supply required to start under full load.

5 GASOLINE ENGINE

This version is perfect when electricity and air are unavailable. It is capable of continuous operation at full pressure. Consists of basic 10,000 psi pump, 4-cycle Briggs & Stratton “Diamond Edge” gasoline engine, developing 6 hp. As with all these pumps, this unit can be valved for use with either single or double-acting cylinders.

SELECTING THE RIGHT VALVE:

Step 1: What is the tool requirement for valve control - single or double-acting?

Step 2: Determine how you intend to plumb the valve in hydraulic circuit - mounted or remote?

Step 3: How will you operate it - manual or remote? What type of directional control is needed?

VALVE SIZING CONSIDERATIONS:

- Will the valve be used with single or double-acting cylinders?
 - Will the valve be mounted on the pump, away from the pump or directly into the hydraulic lines?
 - Will the valve be manually-operated or is remote control preferred?
 - Is independent control of multiple cylinders, or hydraulic tools preferred?
 - What directional control and pressure control valve functions are needed for the application?
- Note: Basic valve types include manually-operated, air or solenoid-operated and pilot-operated. Special application valves for pre-stressing and post-tensioning are also offered. Consult valve selection chart on pages 115-116 for listings of all Power Team valves.

IN-LINE HYDRAULIC VALVES

Load-Lowering Valve – Provides precision metering for controlled return of the cylinder piston.

Sequence Valve – Used when a cylinder in a multiple cylinder application must advance before any other.

Pressure Reducing Valve – Permits independent pressure control to two or more, clamping systems operated by a single power source.

Shut-off Valve – For fine metering of hydraulic oil. Several may be used to control multiple single-acting cylinders.

Check Valve – Permits flow of hydraulic oil in one direction only.

Pressure Relief Valve – Used at remote locations in a hydraulic circuit where maximum pressure requirements are less than the setting of the basic overload valve in the pump. Protects a hydraulic system against over pressurization.

Metering Valve – Restricts surges by restricting flow to a certain level. When flow subsides, valve reopens automatically. For systems using large cylinders or extended lengths of hose.

Pressure Regulator Valve – Permits external adjustment of operating pressures at various values below the internal relief valve setting of the pump.

CAUTION: To prevent sudden, uncontrolled descent of a load as it is being lowered, use a 9596 Load-Lowering Valve or 9720 Counter Balance Valve in conjunction with the directional valve used in your application.

TYPICAL CENTERS

 <p>Cylinder ports are blocked, oil from pump goes to reservoir. Used when pump remains running. Example: gasoline-driven pumps.</p>	 <p>Generally used when running multiple valves in series from one pump.</p>	 <p>Open Center used when holding is not a requirement, as when running two separate hydraulic tools such as cutters / crimpers.</p>

4-WAY/3-POSITION (TANDEM CENTER) MANUAL VALVE

Designed for use with Power Team air, gasoline and electric powered hydraulic pumps.

Applications: Single strand, double-acting stressing jacks with Power Wedge seater.

Actuation: Lever-operated, detent-positioned.

Operation:

1. With valve in center position, pump is started.
2. Cable is inserted into stressing tool, valve is placed in "A" position. "Pull" portion of stressing tool is pressurized to specified level for proper cable tensioning ("A" port is checked internally, can only be released by building pressure in "B" position).
3. Valve is placed in "B" position, which is pressure controlled and will not exceed 6,400 psi. "Return" portion of stressing tool is pressurized and will release "A" port when pressure reaches approximately one-half the "A" port pressure. "A" port remains open as long as this pressure differential is maintained.
4. Pump is stopped, valve is placed in "A" position, releasing "B" port pressure.

Used on these pumps: PA17*, PA46*, PA55, PE17*, PE21*, PE30, PE46*, PE55, PE60, PE120, PE400, PG30*, PG55, PG120, PG400, PQ60 and PQ120 series.

* These pumps may have reduced first flow stage characteristics due to internal valve restrictions.

Order No.	Description
9628	Post-tensioning valve for 10,000 psi (max.) single-acting/Power Wedge seater. Wt., 5.4 lbs.

Accessories

"TWIN" 4-WAY/3-POSITION (TANDEM CENTER) MANUAL VALVE

Pump-mounted, 6-position detented 5-way manual dual valve. Rated pressure to valve "A" is 10,000 psi and valve "B" is 6,000 psi. Case pressure is 500 psi max.

Applications: Multi-strand, double-acting stressing jacks with an auxiliary seating cylinder.

Actuation: Dual lever-operated, detent-positioned.

Operation:

1. With valves "A" and "B" in center position, pump is started, and cable is inserted into stressing tool.
2. Valve "A" is placed in "Stress" position and cylinder extends to tension cable. Pump pressure controls force exerted by tensioning cylinder in this position. "Stress" port is checked internally, and can only be released by building pressure in the valve "B" return position.
3. When desired cable tension is achieved, valve "A" is placed in valve "B" position and valve "B" in "Seat" position. Seating portion of cylinder will be pressurized to seating pressure controlled by "Seat" relief valve (factory set to 3,900 psi).
4. Valve "B" is shifted to "Return" position, which is pressure controlled and will not exceed 2,200 psi. "Return" portion of stressing tool should be pressurized and will release "Stress" port when pressure reaches 15% of "Stress" port pressure.
5. "Stress" port will remain open and cylinder will return as long as pressure differential is maintained. "Stress" and "Seat" ports are open to reservoir.
6. When cylinder has fully returned, both valves are shifted to "Center" position and oil will be directed to reservoir. Maximum pressure setting for the "Seat" relief valve is 6,000 psi.

Used on these pumps: PA17*, PA46*, PA55, PE17*, PE21*, PE30, PE46*, PE55, PE120, PE400, PG30*, PG55, PG120, PG400, PQ60 and PQ120 series.*

3/4-WAY / 2-POSITION SOLENOID ACTUATED VALVES

Application: Single or double-acting cylinders.

Actuation: 9593, 9524 and 9554 are solenoid-operated

Operation with single-acting cylinder: Either oil port "A" or "B" must be plugged on valve. With port "B" plugged, solenoid is energized to position "A," oil port "A" becomes pressurized. When solenoid is energized to position "B," oil port "A" becomes the return port.

Operation with multiple single-acting cylinders: A pressure line from one bank can be connected to oil port "A" and the other to oil port "B" on the valve. Sequence: When energized to position "A," oil port "A" becomes pressurized and clamps the fixture connected to oil port "A." Oil port "B" becomes a "return" port for cylinder connected to oil port "B," and retracts it. The opposite happens when solenoid "B" is energized.

Operation with double-acting cylinder: Port "A" is connected to "advance" port of cylinder, oil port "B" connects to cylinder "return" port. Solenoid is energized to position "A," oil port "A" becomes pressurized to extend cylinder piston. The opposite happens when solenoid "B" is energized. Valve does not hold in "retract" position.

NOTE: When using more than one valve on a pump, the tank port may require a check valve to permit inadvertent, momentary extension of a retracted cylinder.

NOTE: If pump is equipped with an internal outlet check, a "hold" position can be maintained with the pump shut-off.

3/4-WAY / 2-POSITION AIR ACTUATED VALVES

Application: Single or double-acting cylinders.

Actuation: 9595 is air-operated.

Operation with single-acting cylinder: Either oil port "A" or "B" must be plugged on valve. With port "B" plugged, solenoid is energized to position "A," oil port "A" becomes pressurized. When solenoid is energized to position "B," oil port "A" becomes the return port.

Operation with multiple single-acting cylinders: A pressure line from one bank can be connected to oil port "A" and the other to oil port "B" on the valve. Sequence: When energized to position "A," oil port "A" becomes pressurized and clamps the fixture connected to oil port "A." Oil port "B" becomes a "return" port for cylinder connected to oil port "B," and retracts it. The opposite happens when solenoid "B" is energized.

Operation with double-acting cylinder: Port "A" is connected to "advance" port of cylinder, oil port "B" connects to cylinder "return" port. Solenoid is energized to position "A," oil port "A" becomes pressurized to extend cylinder piston. The opposite happens when solenoid "B" is energized. Valve does not hold in "retract" position.

NOTE: When using more than one valve on a pump, the tank port may require a check valve to permit inadvertent, momentary extension of a retracted cylinder.

NOTE: If pump is equipped with an internal outlet check, a "hold" position can be maintained with the pump shut-off.

Order No.	Description
9595	3/4-way 2-position, remote-mounted air-operated solenoid valve (minimum of 50 psi air pressure required), Prod. Wt. 11.4 lbs.

CAUTION: To prevent sudden, uncontrolled descent of a load as it is being lowered, use a 9596 Load-Lowering Valve or 9720 Counter Balance Valve in conjunction with the directional valve used in your application.

CAUTION: The Posi-Check® feature will not hold the load when shifted directly A to B-B to A or from hold to A or B.

NOTE: Maximum tank line pressure for remote-mounted valves is 500 psi.

Model Shown:
9508

4-WAY / 3-POSITION (CLOSED CENTER) AND (TANDEM CENTER) MANUAL VALVES WITH POSI-CHECK®

Application: Single or double-acting cylinders. When used with single-acting cylinders, one port must be plugged. For double-acting cylinders, either port can be used to "advance" or "return."

Actuation: Lever-operated, detent-positioned.

Functions: The 9508 provides "advance," "hold" and "return" positions with all ports blocked (closed center) in the "hold" position. The 9509 has "advance," "hold" and "return" with tandem center (cylinder ports are blocked, pump remains running). Both valves have Posi-Check® feature to guard against pressure loss when shifting from "advance" to "hold."

Order No.	Description

3-WAY / 2-POSITION SOLENOID VALVE

Application: Single-acting cylinders.

Actuation: Solenoid-operated, 115/230/24VAC, 50/60 Hz.

Function: Advances cylinder piston when solenoid is de-energized, and pump is running. When solenoid is energized, oil is directed back through valve "return" port and cylinder piston returns. To place cylinder in "hold" position, pump must be stopped or its flow held at the valve "pressure" port with the solenoid de-energized.

NOTE: Valve is equipped with a 9631 snubber valve in port "A." The line from the "return" port of the valve must be unrestricted (100 psi back pressure maximum) back to the reservoir.

IMPORTANT: A 9580 in-line check valve must be installed in the "pressure" port if the supply pump is not equipped with an outlet check valve.

NOTE: Valves above are shipped without control switch. Use 202777 remote hand switch.

4-WAY / 3-POSITION (TANDEM CENTER) SOLENOID VALVE WITH POSI-CHECK®

Application: Double-acting cylinders.

Actuation: Solenoid-operated, 115/230/24VAC, 50/60 Hz.

Functions: Push button control of "advance," "hold" and "return." The Posi-Check® feature guards against pressure loss when shifting from "advance" to "hold." With valve in "hold" position, cylinder ports are blocked and oil is directed from pump to reservoir.

NOTE: Do not allow return tank pressure to exceed 500 psi at the valve, Consult factory before installing a pressure switch on any of these valves.

Order No.	Description
9514	4-way 3-position (tandem center) solenoid valve, 115VAC, 50/60 Hz. Remote hand control included. Wt., 10.1 lbs.
9525	4-way 3-position (tandem center) solenoid valve, 230VAC, 50/60 Hz. Remote hand control included. Wt., 10.1 lbs.
9555	4-way 3-position (tandem center) solenoid valve, 24VAC, 50/60 Hz. Remote hand control included. Wt., 10.1 lbs.

LOAD-LOWERING VALVE

Application: Precision metering for controlled cylinder piston return.

Operation: Permits free flow when extending cylinder, built-in pressure relief and Posi-Check® locks and holds load in raised position until operator opens valve. May be pre-set to provide consistent metered return, or operator may select rate of return with each actuation. Has 3/8" NPTF ports.

NOTE: Pressure relief valve setting is 12,000 psi. Operating pressure is 10,000 psi and max. flow rate is 5 gpm.

Order No.	Description
9596	Load-lowering valve. Wt., 2.1 lbs.

SEQUENCE VALVE

Application: Used when one cylinder in a multi-cylinder application must advance before any other.

Operation: Pump is connected to port "P" and separate cylinders to ports "A" and "B." When pressure is applied to port "P," cylinder "A" advances. Cylinder "B" will not advance until a predetermined pressure setting is reached in cylinder "A." Pressure setting is adjustable from 500 to 8,000 psi with adjustment screw (factory preset at 1,000 psi). Has 3/8" NPTF ports.

Order No.	Description
9597	Pressure control sequencing valve. Wt., 5.6 lbs.

PRESSURE REDUCING VALVE

Application: Provides complete, independent pressure control to two or more clamping systems operated by a single power source.

Operation: Can be used to provide different pressures in various stages of a single system. Virtually zero leakage across valve means each system can be operated by a single continuous pressure source. Adjustable from 1,000 to 5,000 psi at outlet port "B" (secondary). Has 1/4" NPTF ports.

Order No.	Description
9608	Pressure reducing valve. Wt., 5.8 lbs.

CAUTION: Over Pressure control must be set at a higher value than operating pressure.

COUNTER BALANCE VALVE

Application: Double-acting cylinders. Provides positive holding and controlled, "chatter-free" lowering of a load.

Operation: Load is raised at flow rate of pump, and held when pump is shut-off. When the pump is shifted to "retract," the counter balance valve will continue to hold the load until system pressure exceeds pressure caused by load. The load can then be lowered smoothly to the flow rate of the pump. The counter balance valve is designed to operate with pumps having a high pressure flow rate of up to 120 cu. in./min. and cylinder ratios of 3 to 1.

Order No.	Description
9720	Counter balance valve, including two pairs of fittings (male and female), hydraulic hoses, and dust caps. Wt., 10.0 lbs.
9721	Counter balance valve, including two pairs of fittings (male and female), but does not include couplers, hoses, fittings and dust caps. Wt., 9.2 lbs.

CAUTION: The 9720 patented counter balance valve has a pilot pressure as high as 3,000 psi. Because this pressure is applied to the rod end of the cylinder while it is already under load, the system should not be sized for loads greater than 80% of cylinder rated capacity. To prevent sudden, uncontrolled descent of a load as it is being lowered, use a 9596 Load-Lowering Valve or 9720 Counter Balance Valve in conjunction with the directional valve used in your application.

METERING VALVE

Application: For systems using large cylinders or extended lengths of hydraulic hose.

Operation: Controls surges by restricting flow if it exceeds 7 gpm. When flow subsides, valve reopens automatically. Has 3/8" NPTF male end to thread into return port of system control valve, and a 3/8" NPTF female end, permitting return hose to be directly connected.

Order No.	Description
9631	Metering valve. Wt., 0.2 lb.

"IN-LINE" PRESSURE REGULATOR VALVE

Application: Single or double-acting cylinders. Permits adjusting operating pressures at various values below relief valve setting of pump.

Operation: Regulator valve is easily adjusted to maintain pressures between 300 and 10,000 psi. Maintains a given pressure setting within 3% over repeated cycles. Flow range is 17 cu. in./minute to 6 gpm.

Order No.	Description
9633	In-line pressure regulator valve with two 3/8" NPTF inlet ports, one 1/8" NPTF tank port and 3 foot drain line kit. Wt., 1.9 lbs.

Accessories

RELIEF VALVE

Application: Provide an economical means of protecting a hydraulic circuit against over pressurization.

Operation: These factory preset valves are designed for maximum flow rate of 5 gpm. Furnished with 1/8" NPTF male port. All valves weigh 0.2 lb. See chart below for ordering information.

NOTE: Care should be exercised to protect workers from hot, pressurized hydraulic oil. Install these valves only in an enclosed or shielded area.

PUMP-MOUNTED SUB-PLATES

9515

9521

The 9515 and 9521 mount between the pump cover plate and valve.

When fitted between pump cover plate, valve mounting flange, and control valve, provides a separate 3/8" NPTF female port, open to "return" regardless of position of valve. Also provides a separate 3/8" NPTF female pressure port. This sub-plate can be useful when you desire to use one pump with a deck-mounted control valve, plus a separate remote-mounted valve to control another function.

For use with the following valves: 9500, 9501, 9502, 9504, 9506, 9507, 9511, 9520, 9552, 9572, 9575, 9576, 9592, 9594, and 9609.

Order No.	Description
9515	Sub-plate, Wt., 1.3 lbs.
9521	Sub-plate for use under most pump-mounted valves to provide adjustable pressure control on units not equipped with an external pressure regulator. Wt., 3.8 lbs.

AIR FILTER/REGULATOR/LUBRICATOR

Recommended for use with single-speed air/hydraulic pumps.

Order No.	Description
9531	Filter/regulator. 1/4" NPTF inlet and outlet. Wt., 0.8 lb.

PRESSURE SWITCH

Application: Used in a hydraulic circuit where system pressure must be "held." Automatically (electrically) turns off pump motor when predetermined system pressure is reached.

Attaches directly to control valve manifold or can be mounted in-line to read system pressure. Has a 1/4" NPTF male thread, and a 1/4" NPTF fitting for gauge mounting if required. Adjustable from 1,000 to 10,000 psi. Can also be used to actuate other electrical devices in the system. Wired normally open and held closed by spring pressure.

Order No.	Description
9625	In-line pressure switch with 1/4" NPTF gauge port. Wt., 1.1 lbs.

IMPORTANT: Electrical rating of switch is 5 amps at 250VAC max. To prevent permanent damage to switch, a control relay must be installed to handle currents or voltage exceeding these limits. Pressure switch should never be used to directly actuate the electrical motor.

PILOT-OPERATED AIR CONTROL VALVES

Application: For use when an air pilot signal is required at a set hydraulic pressure. Can be used to shift valves, and start or stop pneumatic pumps.

Attaches directly to control manifold or can be mounted in-line to read system hydraulic pressure. Automatically turns on an air pilot signal when a predetermined system pressure is reached. Has 1/4" NPTF male thread and 1/4" NPTF fitting for gauge mounting if required. Adjustable from 500-10,000 psi. Maximum rating of 25 scfm at 100 psi.

CYLINDER AND HOSE COUPLERS are designed for use up to 10,000 psi with hydraulic jacks, cylinders, etc. They are the threaded union type for interchanging cylinders in seconds. Each half is valved with a precision ball for a tight shutoff when disconnected. These couplers also permit the separation of cylinders or hose from pump when at 0 psi with minimal oil loss.

NO SPILL, PUSH TO CONNECT COUPLERS are designed to permit high oil flow, the no-spill, push-to-connect couplers with locking collar and flush face design are for high pressure applications. The flush-face concept makes it easy to clean both coupler ends before connecting. Our unique push-to-connect, "dry-break" design eliminates oil spillage. The locking collar makes accidental disconnects a thing of the past. For 10,000 psi operation.

Tee adapter (No. 9670) is used for installing a gauge in line in a hydraulic circuit.

Accessories

Hardware Requirements for 9042DG

- Does your pump have a 3/8" or 1/4" NPTF port?
- Are you direct-plumbing the gauge to your tool or seeking to quick-disconnect?
- Refer to the Power Team Catalog under the accessories section for a comprehensive range of fittings and couplers to meet your needs.

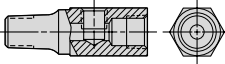

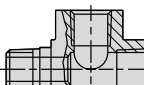

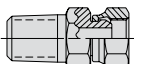

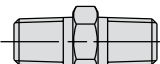

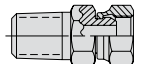

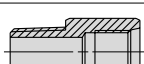

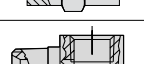

Custom Scale

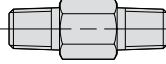

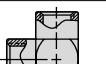

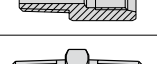

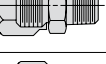

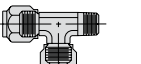

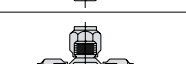

User programmable unit of measure allows you to set a custom scale to have the gauge display torque, force or weight to match the cylinder or tool being used.

Safety Tip

When using couplers to detach the gauge, always use a metal cover (ordered separately) on the pump side (female) coupler when the gauge is removed.

SELECTING THE RIGHT SHOP EQUIPMENT:

Step 1 What is the largest size of material you will be working with on your application? _____

Step 2 What capacity, or pressure, is required to perform the work? _____

Step 3 What is the speed, or frequency, the press will be operated. (ad-hock or production use)? _____

SHOP EQUIPMENT SIZING CONSIDERATIONS:

Knowing how a hydraulic press operates can help you determine whether or not you need one for your application. If a press is needed, ask yourself these four questions.

1. What is the size of the largest work piece? For arbor and H-Frame presses, this will dictate the throat size (horizontal opening) and daylight (vertical space required).
2. What pressure is required OR what capacity is required? For arbor presses and H-Frame presses this will dictate how much force is required to perform the pressing operation. It is recommended
3. What speed and/or frequency do I need to operate the press?
4. How many parts or operations per shift is required? If the required amounts are quite high, an electric or air model power pump would be more suited verses a manual hand pump.

When selecting Power Team's Shop Equipment, you will need to select the type of press style, cylinder size and prime mover to operate and control the press.

Basic components for our shop equipment:

- A pump (or prime mover) is used to transfer the oil from a reservoir out to the tool. This can be in the form of an electric, air or manual pump.
- A control valve is used to divert or meter the flow / direction / volume of the oil out to the tool.
- A cylinder or work-head is used to fill the area above the piston cap with oil through the A-port. This forces the piston down.
- The control valve then redirects the oil either to the B-port for double-acting cylinders or diverts it back to the reservoir on spring return single-acting cylinders.

Horizontal pressing capabilities

⚠ IMPORTANT SAFETY INFORMATION:
Power Team has protective blankets available which may afford protection from injury to users and others should part breakage occur. Power Team recommends the use of these blankets for all pushing, pulling, pressing, and lifting applications.

- 1 2 TO 1 SAFETY FACTOR**
Hydraulic cylinders meet ASME B30.1 standards. Single or double-acting cylinders are available.
- 2 FULL RATED CAPACITY**
Across width of upper frame, even with work-head moved to one side. (Heavy-duty presses only).
- 3 LARGER WORK AREA** than most competitors' models.
- 4 ALIGNMENT LEVER** for simple pin replacement after raising or lowering the bed.
- 5 CLOSE MANUFACTURING TOLERANCE** allows even load distribution over four alloy steel pins, not two, like some competitors. (Heavy-duty presses only).

- 6 OPEN-END-ACCESS™ FEATURE** on 25 ton press provides additional work area by mounting cylinder on outside for C-frame advantage.
- 7 ELECTRIC, AIR OR HAND HYDRAULIC PUMPS** are available. All are standard Power Team pumps. Externally-adjustable relief valve for precise operator control of working pressure is standard on all electric pumps (except PE10 and PE17 series.)
A 24VAC hand switch for remote control on pumps equipped with solenoid valves.
Note: CSA approved electric pumps are standard on all presses.

- 8 RUGGED UPRIGHTS**, 50 percent stronger than channel iron. Four post design means open side for easy loading of long material.
- 9 FAST CYLINDER APPROACH** to work provided by 2-speed hand, air or electric pumps.
- 10 3/8" I.D. HOSE** on spring return cylinders on heavy-duty presses provides up to six times faster cylinder return than standard 1/4" I.D. hose.
- 11 ONE-PERSON OPERATION** for bed adjustment. Winch unit quickly raises or lowers bed to desired height. Self-locking winch mechanism prevents bed from dropping when handle is released.

- 12 FRAMES CAN BE USED HORIZONTALLY** for pressing jobs on extra-long shafts.
NOTE: Certain features do not apply to Power Team 10 ton, Roll-Bed®, or economy presses.
NOTE: Certain press applications may require guarding. Because of the multitude of possible press uses, it is impossible to design a guard that will meet every customer need. The end-user must provide their own guarding where the situations dictate.

SELECTING THE RIGHT JACK:

Step 1: Select the style jack that best suits the application and your intended lift.

Step 2: How much clearance, or open space, is available? What is the minimum height?

Step 3: How much lift, or extension, is required for the load? What is the tonnage needed?

JACK SIZING CONSIDERATIONS:

1. What do you need to lift?

Depending on the vehicle or machine you need to lift, you will require appropriate equipment. You don't lift a 20 ton truck with the same equipment you would use to lift a 2 ton vehicle.

To choose the right fit, first look at the hydraulic jack capacity. Today, on the market, you can find various sizes of hydraulic jacks, with a lifting capacity going from 1 ton to 300 tons, and even more.

2. What is the free space available?

The best jack in the world is useless if you can't place it under the load. Nowadays, application start height is getting lower and lower, requiring a more compact equipment.

Ground clearance is an important parameter to consider, you need to be able to place the jack without damaging the load.

3. What is the maximum lifting height you would need?

To make the best choice, compare the number of strokes and maximum height of each hydraulic jack.

In addition, ask the how many extensions are available with the hydraulic jack. Some of the equipment has 1 or 2 additional extensions, which will cover more applications with the same equipment.

Features

THE RIGHT CHOICE FOR THOSE LOWER HEIGHT APPLICATIONS FOR MRO.

- Telescoping jacks offer all of the quality features and capabilities of the standard bottle jack line with a bonus. The super-long stroke of these jacks saves time and effort by eliminating the need to lift or crib. In most applications, the user can place the jack once and complete the lift.
- The 9006X, 9011X and 9013X all feature a unique beveled base that allows the jack to “follow” the load laterally as it is raised, greatly reducing side-loading of the piston.
- High strength piston and pump linkage for long life.
- All models include over-travel protection.
- Lever Bar included on all models.
- All jacks meet ASME B30.1 standards and carry the Power Team PowerThon™ Lifetime Warranty.

- Spring return is an added feature on the J55T and J106T jacks.
- Swiveling pump handle assembly available on the 5 and 10 ton models. The swiveling jack assembly allows you to access and pump the unit from numerous positions.
- High strength piston and pump linkage for long life.
- All models include over-travel protection.
- Lever Bar included on all models.
- All jacks meet ASME B30.1 standards and carry the Power Team PowerThon™ Lifetime Warranty.

► The non-skid reinforced inflatable jack is perfect for many applications.

Features

LOW HEIGHT, HEAVY-DUTY INDUSTRIAL INFLATABLE AIR JACKS.

- Non-inflated jacks are less than 1" thick, making lifting tasks in small spaces seem routine.
- Constructed of non-conducting, high quality rubber material with multi-layer aramid fiber reinforcement.
- The top and bottom surface of the jack has a skid resistant, interlocking pattern to assist in alignment of two jacks being used together.
- Heavy attachment handles are provided on the two largest jacks for attachment of a rope or hook to help in positioning the jack.
- The jacks can be used at ambient temperatures of -4°F to +122°F (-20°C to + 50°C).
- The controller, shut-off and air hoses are all equipped with an industrial interchange style quick-disconnect air coupler. Female half coupler bodies have a locking collar to help the operator avoid accidentally disconnecting the jack while under load.
- Single jack controller with "dead man" control (part no. 350090) can be used individually, or in multiples to regulate the number of jacks desired.

Safety Hints

BE SAFE!

- INSPECT BEFORE AND AFTER EACH USE.
- REPLACE IF ANY SIGNS OF DEGRADATION OR WEAR THAT MAY AFFECT SAFETY OR PERFORMANCE.
- KEEP THE PRODUCT CLEAN.
- STORE PROPERLY.

Maximum Effective Lifting Area

All lifting capacities mentioned in the charts are measured at the maximum effective lifting area (A). As the jack is inflated (B), this effective area decreases (C) due to the rounded shape of the jack. Lifting capacity also decreases (see performance chart).

Stack up to two jacks together to increase effective lifting height.

QUALITY MEANS LOWER COST OF OWNERSHIP

- Designed for high cycle life (2-3x more than existing technology)
- Increased reliability provided by simple drive assembly means less downtime
- Corrosion resistant material for use in harsh environments

ENHANCED USABILITY:

- Compact nose radius allows the tool to fit in tighter, hard-to-reach spaces
- Low weight, high strength design
- Fast operation, long stroke and optimum flow
- Multi-direction high flow swivel manifold
- Push-button square drive reversal and reaction arm positioning for all models except TWHC50.

DESIGNED WITH SAFETY IN MIND:

- Fully-enclosed drive mechanism for operator safety
- Swivel manifold internal relief valve prevents retract side over-pressurization
- Fine tooth pawl prevents tool 'lock-on'

▶ The TWS50 is the perfect choice in this power generation application.

HANDLES SOLD SEPARATELY

The tool's designed long-stroke mechanism imparts a minimum 30 degree nut rotation per stroke while maintaining a tight and compact nose radius. This is a clear advantage over the short stroke and back-up pawl mechanisms of light alloy competitive models. Fewer parts and reduced torsion in operation equals reduced wear, maintenance and associated costs.

* Dimension I shows thread size (on both sides of the tool) for safety handle or lifting point. TWHC50 model available with lifting points only.

Drive Body interchanges with the TWLC & TWSL link sizes

Order #: *DFTAS000001* for TWSL2
DFTAS000002 for TWSL4

The Drive Body is designed to interchange with the TWLC (Low Clearance) and the new TWSL (SlimLine) Links, lowering your tool investment across each series to broaden your application reach.

Handle can be mounted to either Link or Drive Body. TWLC4 only - use adaptor DFTHA000003 to mount handle to drive body

HTS50 HEAVY-DUTY PIPE SEALANT WITH PTFE

- Seals new or damaged threads; resists water, chemicals and oils.
- Replaces conventional tape methods; forms a clog-free seal.
- Effective at 10,000 psi.

When "plumbing" a hydraulic system, there's now a better answer than tapes which can tear or shred, possibly plugging filters, valves or gauges. This compound combines the lubricating qualities of PTFE with a fast curing anaerobic sealant. Seals all metal fittings, plugs and threaded joints quickly and easily. Cures to form a permanent seal which is inert to hydrocarbons, most acids, chemicals, solvents and steam. Allows adjustment up to 16 hours after assembly; won't loosen under vibration. Prevents galling of mating parts upon disassembly. Withstands temperatures from 65° F to +375° F.

Note: Product labeling may vary from picture.

SELECTING THE RIGHT PULLER:

Step 1 Determine if you are pulling a shaft or hole out of something?

Step 2 Is your application requiring pulling and pushing?

Step 3 What is the reach, spread, and force required to perform the application?

PULLER SIZING CONSIDERATIONS:

1. Determine the type of puller or puller combination needed?
2. Which puller type is best suited for gripping the part?
3. Is a combination of puller types required?
4. Determine the reach needed for your particular pulling problem. The puller you select must have a reach equal, or greater than, the corresponding sizes of the part to be pulled.
5. Determine the spread needed. The spread is determined by the width of the part being pulled. The pullers spread should be greater than the width of the part to be pulled
6. Estimate the force needed to solve your pulling problem. A puller with the proper reach and spread will usually have enough capacity to remove the corresponding part. (Note: When in doubt, always use a puller with a larger capacity than what may be needed. Rusted parts, or parts with a large area of resistance, may need more pulling force).

PULLER SELECTION OPTIONS:

PULLING A PRESS-FITTED SHAFT FROM A HOUSING

A shaft with a threaded end can be removed without damage by using one of our slide hammer, manual or hydraulic Bi-Directional™ Puller, in conjunction with the proper threaded adapter. Removal is easy! If the shaft to be removed has external threads, simply choose one of our female threaded adapters of proper size/thread. If the shaft has internal threads, simply choose the correct size male threaded adapter.

Note: Manual pullers require that the shaft being pulled is no more than twice the diameter of the pullers forcing screw. To determine the recommended tonnage for hydraulic pullers, multiply the diameter of the shaft to be pulled by ten. Example: For a 1" shaft, we recommend 10 tons of pulling force.

SUGGESTED TOOLS:

Slide hammer puller matched with a set of threaded adapters is a perfect tool for light duty pulling needs.

Bi-Directional™ Puller matched with a set of threaded adapters make for an extra versatile pulling tool.

PULLING INTERNAL BEARING RACES, RETAINER, SEALS, ETC.

By extending the narrow jaws of an internal pulling attachment through the center of the part to be pulled, a straight pull is insured, and damage to the housing is avoided. While parts within a “blind hole” in a housing do present a problem, Power Team has the internal pulling attachment or a combination of an internal pulling attachment and puller to handle the situation.

SUGGESTED TOOLS:

Internal pulling attachments have narrow jaws which extend through the center of the part to be pulled. They provide a straight pull and avoid damaging housings. Internal attachments feature adjustable jaws to fit various diameter parts.

Slide hammer with internal attachment is ideal for removing parts from blind holes, especially where there is no housing to brace puller legs against.

Bi-Directional™ Puller with internal attachment is available in both manual and hydraulic versions.

PULLING A GEAR, BEARING, WHEEL, PULLEY, ETC., FROM A SHAFT

In order to perform a proper pull, be certain that you firmly grip the gear, bearing, wheel, pulley, etc., and apply force to the shaft. Use a 3-jaw puller, instead of a 2-jaw, whenever possible for better gripping power and a more uniform displacement of pulling force.

SUGGESTED TOOLS:

Jaw-type pullers: Either manual or hydraulic. For extra force and convenience, use a hydraulic puller. Both are available in 2 or 3-jaw configurations and are used to grip the outer circumference of a part or can be used with a pulling attachment, such as a bearing / pulley attachment.

Bi-Directional™ Puller: Can thread directly into a threaded part for easy and secure removal. Bi-Directional™ Pullers can be used in conjunction with bearing/pulley attachments which grip the part from behind. A wide assortment of male and female threaded adapters are available as well as metric adapters.

Slide Hammers: Best suited for light-duty tasks. Slide hammers can be used for multiple pulling problems when combined pulling attachments.

Bearing/pulley Attachments: Provide a “knife-like” edge to get behind parts for added versatility and secure removal of parts. Great for parts that don’t offer adequate grip with jaw-type pullers.

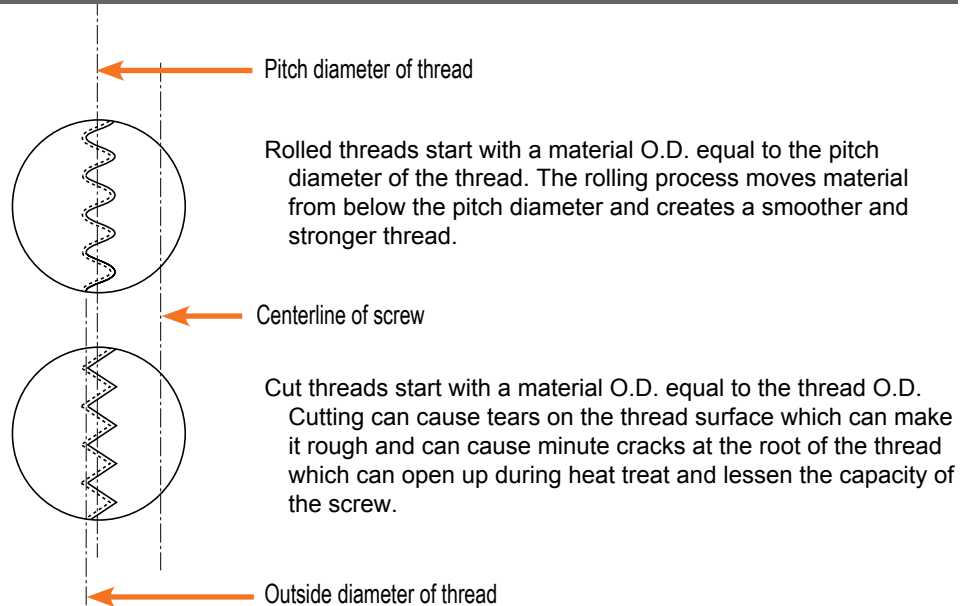

Adapters: Whether you need an adapter compatible with any number of threaded hole sizes, protecting the part to be pulled or for assisting the installation of a component; Power Team offers a variety of adapters to assist in the removal or installation of parts.

▲ CAUTION: The puller application photos shown in this catalog are shown without protective blankets for clarity of photos. Power Team strongly recommends you always make your pull with a protective device in place.

Operator safety comes first!

High levels of force are being exerted with your pulling system. You must respect this force, and observe safety precautions at all times.

A few easy tips to remember:

- 1. Wear safety glasses at all times!** Protect your eyes from possible flying parts.
- 2. Keep your pulling tools in shape!** Clean and lubricate the pullers forcing screw frequently, from threads to tip, to assure long service life and proper operation.
- 3. Cover work with a Puller blanket!** Power Team puller blankets are designed to contain broken or flying parts from the most extreme forces, thus resulting in a much safer work environment.
- 4. Apply force gradually!** The component should give a little at a time. Do not try speed removal by using an impact wrench on the puller screw.
- 5. Use the right size puller!** If you have applied maximum force and the part has not moved, go to a larger capacity puller. Resist sledging.
- 6. Align puller legs and jaws!** Be sure the setup is rigid and that the puller is square with the work.
- 7. Mount puller so grip is tight!** Tighten the adjusting strap-bolts when using a jaw type puller. Always use a 3-jaw puller whenever possible. A 3-jaw puller gives a more secure grip, and pulling power. Apply force gradually. Never use an extension on a wrench. Never use an impact wrench. Never strike the end of the forcing screw.
- 8. Do not couple puller legs!** The tonnage capacity of a Bi-Directional™ Puller is reduced when longer than standard legs are used, or when legs are in compression. The chance of breaking, bending or misaligning legs increases. Keep reach to a minimum. Use shortest legs possible to reach the workpiece. Thread legs into workpiece, pulling attachment or adapters evenly. Uneven legs will cause greater pull or push on one side, creating a bending action which could cause damage to workpiece or cause a leg to break. The sliding plates must always be on the opposite side of the cross block from the forcing screw nut or hydraulic cylinder.

Bearing pulling attachments:

These attachments may not withstand the full tonnage of the pullers with which they are used. The shape and condition of the part being pulled affects the tonnage at which the puller blocks and/or studs may bend or break. Always select the largest attachment which will fit the part to be pulled.

CAUTION

It is impossible to predict the exact force required for every pulling job. Setup requirements and the size, shape and condition of the parts being pulled vary a great deal. In addition, the Power Team pulling system is so versatile, it is possible that components in a pulling setup may have different tonnage ratings.

The lowest “capacity” component, then, determines the capacity of the setup. For example: When an accessory with a 1 ton capacity is used with a 10 ton capacity puller, the setup can be used only at a force of one ton.

These tools should be used only by trained personnel familiar with them.

Always wear eye protection during a job since work parts, or the pulling tool itself, may break and parts may fly. It is recommended to cover the work with a Power Team protective blanket or use a shield while force is being applied.

If you are at all unsure which tool or attachment to select, contact the Power Team factory.

BLIND HOLE PULLER SET

blind hole puller example

Removal of bearings, bushings, sleeves and other friction-fitted parts from blind holes can now be accomplished with ease. Set provides selection of expanding collets 5/16" to 1-3/4" I.D. Collet is placed through bore of part to be removed, then expanded with actuator pin so that lips of collet secure a positive grip for pulling. Pulling force is exerted by means of a forcing screw and bridge assembly or with a slide hammer. Equipped with a plastic case.

Features

SAFETY CAGE® GUIDES JAWS FOR FAST SET-UP, SOLID CONTACT AND SUPERIOR SAFETY

- With Power Team Posi-Lock®, pulling bearings is a one-person operation. The T-handle and “Safety Cage®” control the jaws at all times. This means that the opening, closing, locking and aligning of the jaws is all done automatically by simply turning the T-handle.
- Hydraulic pullers come with a lift plate for ease of transport and lifting. In addition, ram points of different sizes are available for a variety of applications
- Using a hydraulic puller system adds efficiency and eliminates unsafe practices such as hammering, heating, or prying components to be removed. The cylinder replaces the center bolt function of a manual puller.
- Pullers are used whenever there are tough maintenance challenges. Examples include: Railroads, Steel & Paper Mills, Mines, Oil Fields, Wind Farms, Factories, Power Plants, Shipyards, etc.

Pullers

- 1 Hydraulic cylinder reacts off shaft enabling jaws to extract object in a controlled manner.
- 2 Mechanical pullers use a center bolt to provide force on the shaft enabling jaws to extract object in a controlled manner.
- 3 T-handle facilitates the opening, closing, locking and aligning of the jaws.
- 4 Safety Cage® guides jaws for quick setup, providing a “vise-like” grip reducing slippage.
- 5 Forged jaws provides superior durability.
- 6 Slim tapered jaws allow for easier gripping and better access to tight spots.
- 7 Optional hydraulic cylinder tips to meet your application needs.
- 8 Wide range of standard and long jaw reach arms to increase your versatility.

SELECTION AND CAPACITY RATING – Each Bi-Directional™ Puller's specified tonnage "capacity" is determined using its standard legs in tension. Using longer legs, or a setup in which the legs are in compression, will reduce the "capacity." Always select the largest "capacity" puller and the shortest legs that will fit the job.

POWER-TWIN® CYLINDER – This unique center-hole cylinder powers each Bi-Directional™ Puller screw runs right between the twin spring cylinder. A basic head allows you to change from a tapped hole to a plain hole by merely changing the head insert.

Features

THE POWER TO MAKE IMPOSSIBLE JOBS BECOME ROUTINE.

- Can apply a hydraulic pushing or pulling force, depending on how the puller is set up.
- Each unit includes perfectly matched hydraulic components that can be detached from the Bi-Directional™ Puller for other tasks requiring dependable power, and assuring maximum return on your investment.
- Optional leg kits adapt your Bi-Directional™ Puller to extra long or extra short reach.
- A wide variety of threaded adapters, bearing pulling attachments and internal pulling attachments can be used in combination with our Bi-Directional™ Pullers.

ASSEMBLING THE TOOL TO APPLY PUSHING OR PULLING FORCE:

1. Determine if you want the tool's forcing screw to push or pull.
2. To exert pushing force, the forcing nut is installed beneath the cross block, as shown on left.
3. To cause the forcing screw to pull, the forcing nut is placed on top of the cross block.
4. The sliding plates must always be placed on the opposite side of the cross block from the forcing nut.

- 3 Hydraulic lift system for easy, precise position of puller.
- 4 Unique dual pump arrangement. Low pressure pump positions, holds and opens jaws. The high pressure pump advances and retracts the pushing cylinder without releasing clamped jaws.
- 5 Swivel casters give ease of mobility.
- 6 Large wheels make movement of cart easy.
- 7 Super Lock-Jaw™ feature means the harder the pull, the tighter the puller jaws grip. No chains or cages required to keep puller jaws from slipping or springing off the part being pulled.
- 8 Guards at pinch points protect operator.
- 9 Puller can be mounted on cart 90 degrees to right or left of puller cart centerline, permitting use in tight quarters, such as between machinery.
- 10 Self-centering design puller jaws will automatically grip work evenly.
- 11 Choice of cylinder with a 6.25" or 13.25" stroke.

Wear appropriate Personal Protective Equipment (PPE).

Read all instructions.

Do not exceed the rated load of any pump, tool or component.

Inspect all components before use. Do not use damaged or worn components. Return to an Authorized Repair Center for repair or replacement.

Never alter internal relief valves.

Recognize system pressures. Do not use a 10,000 PSI pump on a system with 3,000 PSI components (hoses, fittings, valves, tools, etc.).

Do not use pumps designed for torque wrenches or tensioners for lifting.

Do not overfill pump reservoirs.

Use only high quality oil, like SPX Power Team hydraulic oil. Using the wrong fluid can lead to equipment damage and premature failure.

Do not use the same oil in all equipment and in all environments.

Change oil and/or filters at appropriate intervals.

Do not operate a pump with couplers exposed or uncapped.

Clean both ends of the couplers before assembly.

Do not kink hydraulic hoses.

Replace damaged hoses immediately.

Keep equipment away from excessive temperatures. Do not weld next to unprotected equipment.

Keep couplers capped when not in use.

Do not drive over hoses or drop objects onto them.

Only use tools for their intended purpose.

Keep hands clear of pinch points.

Only use high quality impact sockets and reducers with an appropriate load rating and safety factor.

Always connect both torque wrench hoses to the pump. Do not operate with only one hose attached.

Use only the proper size sockets and links.

Customer needing a more reliable way to lift empty rail cars to install wheels. The cars are empty, but require fast speed for lifting. The standard RJ100T37E was slower than customer desired.

Solution:

RJ100T37E modified with a PE1204FR pump

Application / Industry Highlight

Shipbuilding / Repair, Transportation

Situation:

Customer manufactures propeller shafts for large military vessels (Air Craft Carriers, Destroyers, etc). Having trouble with concentricity of dissimilar metals pulling apart during welding process, they needed something to keep them clamped.

Solution:

8-PH82K pullers

Application / Industry Highlight

Forklift Maintenance, Manufacturing

Situation:

Maintenance Technicians were getting injured lifting and positioning heavy floor jacks for routine maintenance on forklift machinery.

Solution:

Supplied IJ3615 Inflatable Jack, 350090 Pendent, (2) 350208 30' Hose

Application / Industry Highlight

Power Plant, Energy

Situation:

The incinerated coal is mixed with water and transported through several pipelines to the repository by very powerful pumps. These pipelines have flanges of various sizes. These flanges must be opened in certain periods and the seals must be changed.

Solution:

Hydraulic Torque Wrench set (TWHC1, TWHC3, PE45)

Application / Industry Highlight

Copper Mine, Mining

Situation:

Customer needed to lift this 680 Ton structure in a synchronized manner to replace the six-ton slewing bearing for this ship loader.

Solution:

Supplied one Motion Control System and 3 - 280 Ton Lock Nut Cylinders

Countless applications are possible with Power Team hydraulic components. From pressing, lifting, and jacking applications to production or maintenance setups. The diagrams are typical electric/hydraulic units. Electric, air or gas-driven pumps are available.

Hydraulic Circuit Components

- 1 **Cylinder** – applies hydraulic force.
- 2 **Pump** – a device for converting mechanical energy to fluid energy.
- 3 **Directional valve** – controls the direction of hydraulic fluid in the system.
- 4 **Gauge** – measures pressure (PSI - Pounds per Square Inch) and/or force.
- 5 **Hose** – transports hydraulic fluid.
- 6 **Manifold** – allows distribution of hydraulic fluid from one source to several cylinders. (9617)
- 7 **Swivel Connector** – allows proper alignment of valves and/or gauges. Used when units being connected cannot be rotated. (9675)
- 8 **Quick Coupling** – “hose half” and “cylinder half” couplings are used for quick-connection and fluid flow check when separated. (9797 and 9798)
- 9 **Shut-Off Valve** – regulates the flow of hydraulic fluid to or from cylinders. (9642 or 9644)
- 10 **Load-Lowering Valve** – allows metered lowering of cylinder and provides safety when prolonged load holding is required. (9596)
- 11 **T-Gauge Adapter** – allows for installation of pressure/tonnage gauge anywhere in the hydraulic system. (9670)
- 12 **Pipe Plug** – for blocking unused ports within the system. (9687)

* SYSTEM INTERNATIONAL (MODERN METRIC SYSTEM)

Selecting the appropriate equipment for your application can be accomplished by following these three steps.

1) Understanding the “Pain Points”

2) Connect “Application” to a Function

3) Select the correct tool for the function required

STEP 1: Determine the type of lift or tool required for your application:

- Single or multiple-point lift?
- Balanced or unbalanced load?
- Guided or unguided load?
- Pulling, pressing, punching, spreading or torquing?

STEP 2: Choose the right cylinder or tool for your specific application:

- Determine the force required. (Power Team recommends using 80% of the rated capacity and stroke to maximize product performance and safety.)
- Determine the total amount of oil required for each cylinder(s) and/or tool(s).
- Determine the closed height, stroke requirement and diameter footprint allowable.
- Push and/or pull requirement. For cylinders, single-acting, load return, spring return or double-acting hydraulically driven both ways.

STEP 3: Choose the right pump source for your application based on your cylinder /tools and oil / speed requirements:

- What is the maximum system operating pressure requirement?
- What is the volume of oil required? Add all of the cylinder(s) and/or tool(s) cubic volume requirements and add 1 cubic inch per 1.66 foot of hose.
- What is the preferred source of power? (hand, air, electric, or gas). If hand pump is selected, choose between single or two-speed.
- Do you need this to be portable? (consider weight and size).
